

SYNTHEX EVIDENCE REPORT

Executive Summary · for Decision makers

What this report proves

Synthex turned web data into court-grade evidence: every source was fetched, screened for malicious content before reaching the LLM, classified, and cryptographically sealed. The seal proves WHEN and that the bytes are UNCHANGED — not that the underlying claims are true.

Seal method : HMAC-SHA256 + RFC 3161 TSA
RFC 3161 TSA : digicert (RFC 3161)
genTime : 2026-05-28T01:59:31.000Z
serial : 293d09c287bb1a66784c34be2edb3d06

Scan the QR or follow page 6 to verify this seal yourself, offline, with OpenSSL.

Threats blocked by FORGE (pre-LLM)

FORGE is a deterministic regex pre-filter that runs BEFORE any LLM call. It blocks injection and exfiltration vectors so they never reach (or poison) the model. Categories are mapped to their OWASP reference class. The pre-filter is heuristic, not formally verified.

No malicious content detected in this batch.

All fetched sources passed the FORGE pre-filter and were forwarded to classification.

Classification severity (per lens)

[GTM] severity 7/10

Recorte de precio agresivo (-20%) + free tier: presión competitiva alta.

signals: price-cut · free-tier · 10k-api-calls

[GTM] severity 6/10

Expansión de ventas enterprise en EMEA: señal de go-to-market.

signals: hiring · enterprise-sales · EMEA

SYNTHEX EVIDENCE REPORT

Cost & Efficiency · for CFO

Token cost saved (deduplication)

FORGE deduplicates fetched documents by full SHA-256 before classification: every duplicate block removed is one fewer LLM call paid for. The ratio below is exact (not estimated).

Unique blocks 2

Duplicate blocks 1

Dedup ratio 33.3% (LLM calls avoided)

Bytes saved 93 bytes not sent to the model

Latency per stage (wall-clock)

Measured by the pipeline (evidence.timings), outside the sealed payload so it never affects verification.

FETCH		0.4 ms
FORGE		4.3 ms
CLASSIFY		0.2 ms
PROVE		450.6 ms
		Total: 455.5 ms

EU AI Act — Article 12 (record-keeping / logging)

Article 12 requires high-risk AI systems to automatically record events ('logs') enabling traceability. This report is itself such a record: an immutable, timestamped log of the data lifecycle, sealed so any tampering is detectable.

OK	Traceability of inputs	3 source URL(s) recorded
OK	Pre-processing log	0 block(s) by FORGE pre-filter, with category
OK	Classification output	2 finding record(s) retained
OK	Integrity of records	HMAC-SHA256 over canonical payload (present)
OK	Timekeeping (independent)	RFC 3161 TSA — digicert, 2026-05-28T01:59:31.000Z
OK	Tamper-evidence	SHA-256 content hash: 6f04b70406e149123cb68f33...
OK	Record timestamp	2026-05-28T01:59:31.959Z

This is an evidentiary record, not legal advice. Mapping to Article 12 is provided as a good-faith aid. Deploying system is classified high-risk.

SYNTHEX EVIDENCE REPORT

Risk Snapshot · for Broker / Underwriter

Synthex Risk Score (internal estimate)

49

/ 100

MEDIUM RISK

How this number is computed (honest formula)

```
maxSev    = max severity across all findings ..... 7/10
blockTerm  = min(blockedCount, 5) / 5 * 10 ..... 0.0/10 (blocked=0)
score      = round( (maxSev*0.70 + blockTerm*0.30) * 10 ) = 49
```

DISCLAIMER

This Risk Score is an INTERNAL ESTIMATE produced by Synthex from the data in this report, using the deterministic formula shown above. It is NOT a Munich Re assessment, NOT an insurance rating, and NOT underwriting advice. No third party has reviewed or endorsed this number.

Reproduce the proof offline

RFC 3161 proves WHEN this content was sealed — not that the content is TRUE. The HMAC proves integrity against the issuing key. Reproduce the checks yourself with OpenSSL:

```
# 1. Decode the trusted timestamp token shipped in the report JSON (seal.rfc3161Tsa.token):  
echo "<base64-token>" | base64 -d > synthex.tsr  
  
# 2. Inspect the DigiCert RFC 3161 reply (works offline):  
openssl ts -reply -in synthex.tsr -text  
  
# 3. Confirm the messageImprint in that output equals this SHA-256:  
# 6f04b70406e149123cb68f33b522f843a1cc882d5a6b4cc2e5ba3fb312325dbb  
  
# 4. Full chain validation (needs the DigiCert CA chain):  
openssl ts -verify -in synthex.tsr -CAfile digicert-chain.pem -sha256
```

```
6f04b70406e149123cb68f33b522f843a1cc882d5a6b4cc2e5ba3fb312325dbb
```
